1. First open a command prompt and run server program. The server will wait for client to be connected.
2. Now open another

command prompt and  
run client program.

This will connect client  
with server. Enter a  
message at client side  
to send it to server.

After running the client application, a message will be displayed on the server console.

Example of Java Socket Programming (Read-Write both side) In this example, client will write first to the server then server will receive and print the text.

Then server will write to the client and client will receive and print the text. The step goes on.

### **Java Socket Programming (Java Networking Tutorial ...**

Welcome to Java  
Socket programming  
example. Every server  
is a program that runs  
on a specific system  
and listens on a  
specific port. Sockets  
are bound to the port  
numbers and when we  
run any server it just  
listens on the socket  
and waits for client  
requests. For example,

tomcat server running on port 8080 waits for client requests and once it gets any client request, it responds to them.

Java has a different socket class that must be used for creating server applications. ServerSocket class is used to create servers

## **Socket Programming in Java - GeeksforGeeks**

The  
java.net.Socket class  
represents the socket  
that both the client and  
the server use to  
communicate with  
each other. The client  
obtains a Socket object  
by instantiating one,

whereas the server obtains a Socket object from the return value of the accept() method. The Socket class has five constructors that a client uses to connect to a server –

## **Java socket programming - Simple client server program**

Java sockets have input  
streams and output  
streams built in, which  
makes programming  
rather pleasant. Four  
applications are  
presented in order of

A trivial date server and client, illustrating simple one-way communication. The server sends data to the client only.
